In August 2021, local contractors installed 68,864 SF (6,397m²) of Concrete Canvas® (CC5) to line berms surrounding 9 fuel storage tanks. The objective was to provide erosion protection of the berm slopes located on the fuel tank farm at a hydroelectric site.

The installation had to be done quickly and with a lining solution that offered: erosion protection, fire-protection capabilities (for safety reasons), and weed suppression to eliminate maintenance needs.

Concrete Canvas® (CC5) was chosen for this project, meeting all the criteria, and offering a long-term, safe, and cost effective solution. The timeline for delivery and installation was short, as safety on the site was a top priority. Nevertheless, the project was successfully completed in just three weeks.
